Topic : CRC

Frame

CRC-32 : [32-bit / 4 byte]

$$G(X) = X^{32} + \dots + 1$$

Topic : Cyclic Code

CRC [$G(X) = X^3 + 1$] and 3 data bits

$$\begin{array}{r} 1001 \overline{) 001000} \\ \underline{1001} \\ 001 \end{array}$$

$$\begin{array}{r} 1001 \overline{) 100000} \\ \underline{1001} \\ 100 \end{array}$$

Cyclic Code

Topic : Valid Codewords vs Invalid Codewords

k-bits input (data) \rightarrow n-bits output (codeword)

$$\rightarrow \text{Number of parity bits} = (n - k)$$

$$\rightarrow \text{Number of valid codewords} = 2^k$$

$$\rightarrow \text{Number of invalid codewords} = (2^n - 2^k)$$

Topic : Error Detection and Correction

Types of error correction techniques :

1. 2D Parity
2. Hamming Code

Detection Only

① CRC

→ one bit parity

② Checksum

Topic : 2D Parity

→ Both sender and receiver must agree on same block size and same parity (either even or odd parity)

→ Block Size = $m * n$
[m rows & n columns]

Number of Data bits = $(m-1) * (n-1)$

Number of parity bits = $[m + n - 1]$

Topic : 2D Parity

Suppose **Block Size** = **4 x 6** and “**Even Parity**”

Data = “1 0 0 1 1 0 1 1 0 1 1 0 0 1 0”

Sender					
1	0	0	1	1	1
0	1	1	0	1	1

Parity of parity

Topic : 2D Parity

Suppose Block Size = 4 x 6 and "Even Parity"

Data = "1 0 0 1 1 0 1 1 0 1 1 0 0 1 0"

Sender

1	0	0	1	1	1
0	1	1	0	1	1

Received Data = "1 0 0 1 1 1 0 1 1 0 1 1 1 0 0 1 0 0 0 1 1 0 0 0"

Topic : 2D Parity

if receiver finds all row wise and column wise parities are balanced
then receiver concluded "No any error detected"

else

receiver concluded "Error detected"

Topic : 2D Parity

Suppose Block Size = 4 x 6 and "Even Parity"

Data = "1 0 0 1 1 0 1 1 0 1 1 0 0 1 0"

Topic : 2D Parity

$\max(0, 0)$

CASE I : No any error

all row wise
parities
are balanced

all colom wise
parities are
balanced.

Topic : 2D Parity

$\max(1, 1)$

CASE II : One-bit error

Topic : 2D Parity

CASE III : Two-bit error

$$\max(0, 2)$$

$$\max(2, 0)$$

$$\max(2, 2)$$

CASE IV : Three-bit error

Topic : 2D Parity

CASE V : Four-bit error

Topic : 2D Parity

Minimum number of bits corrupted in the Block

$$= \text{Maximum} [\text{total number of row wise parity unbalanced,} \\ \text{total number of column wise parity unbalanced}]$$

#Q. Data transmitted on a link uses the following 2D parity scheme for error detection:

Each sequence of 28 bits is arranged in a 4×7 matrix (rows r_0 through r_3 , and columns d_7 through d_1) and is padded with a column d_0 and row r_4 of parity bits computed using the Even parity scheme. Each bit of column d_0 (respectively, row r_4) gives the parity of the corresponding row (respectively, column). These 40 bits are transmitted over the data link.

The table shows data received by a receiver and has n corrupted bits. What is the minimum possible value of n ?

r ₂	0	0	0	1	0	1	0	0
r ₃	0	1	1	0	1	0	1	0
r ₄	1	1	0	0	0	1	1	0

Topic : 2D Parity

→ Receiver detect and correct "all single bit error"

→ In case of burst error,
receiver may able to detect "burst error"

odd parity

1	0	1	0	1
0	1	1	0	1
1	1	0	1	0
1	1	1	0	0

odd parity

1	0	1	0	0	1
0	1	1	0	1	0
1	1	0	1	0	0
1	1	1	0	0	0

Topic : Hamming Code

- Single bit error-correcting code
- Both transmitter and receiver must agree on same parity
[either "Even Parity" or "Odd Parity"]
- Number of data bits = m
- Number of parity bits = r
- Code length (n) = [m + r] bits
- Hamming (n, m)
